Franklin, Indiana
IDEM Site Identification Number 2013-34567
Patriot Project No.: 17-0995-01E

Dear Mr. Cafouros,

Patriot Engineering and Environmental, Inc. (*Patriot*) is pleased to submit this DRAFT report for the Additional Site Investigation (ASI) performed at the above-referenced Site. The ASI was conducted in response to a directive from the Indiana Department of Environmental Management (IDEM) that further investigation of the Hurricane Road Industrial Development (HRID) property and the adjacent Reed Manufacturing property be conducted currently. This report details the activities performed by *Patriot* on the HRID property, and summarizes the activities performed by Ramboll Environ US Corporation on the Reed Manufacturing property.

If you have any questions or comments regarding this report, please do not hesitate to contact Mike Casper at (317) 576-8058 or mcasper@patrioteng.com.

Respectfully submitted,

Patriot Engineering and Environmental, Inc.

1.0 INTRODUCTION

Patriot Engineering and Environmental, Inc. (*Patriot*) was retained by Kroger, Gardis & Regas, LLP on behalf of Hurricane Road Industrial Development, LLC (HRID) to conduct an Additional Site Investigation (ASI) of the HRID property located at 1130 East Eastview Drive in Franklin, Indiana (henceforth referred to as the Site). The location of the Site is depicted on the Site Location Map included as Figure 1 in Appendix A, while the layout of the Site is depicted on the Site Map included as Figure 2 in Appendix A. The ASI was conducted in response to a Further Site Investigation Review letter from the Indiana Department of Environmental Management (IDEM) dated April 4, 2017 requiring further investigation of soil and groundwater conditions on the Site and on the adjacent RCO-Reed Corporation d/b/a Reed Manufacturing Services (Reed) property, both of which make up the Former Houghland Tomato Cannery (Houghland) property as described below. This report documents the activities conducted during the ASI and presents our findings and conclusions relative to the Site.

2.0 SITE BACKGROUND

2.1 Site Description

The Site is a portion of the former Houghland property, a former tomato canning operation, that was subsequently divided into two properties. Mr. Robert Clawson, doing business as HRID, owns the eastern portion of the former Houghland property at 1130 E. Eastview Drive (IDEM Site Identification Number 2013-34567). Mr. Clawson leases the buildings on the property to various commercial tenants. Reed owns and occupies the western portion of the former Houghland property at 1056 E. Eastview Drive (IDEM Site Identification Number 2013-42015). *Patriot* had previously conducted environmental investigations at the Site, while Ramboll Environ US Corporation (Ramboll Environ) had previously conducted environmental investigations on the Reed property.

2.2 Chemicals of Concern

Investigations that have been performed at the Site and on the Reed property have revealed the presence of volatile organic compounds (VOCs) in soil and groundwater on both properties. The chemicals of concern (COCs) present at the properties are primarily the VOCs tetrachloroethene (PCE) and trichloroethene (TCE), with lesser amounts of cis-1,2-dichloroethene (cis-1,2-DCE). The COC impacts on the two properties appear to be interrelated, although an actual source area or areas has not been identified.

2.3 Additional Site Investigation Background

Patriot has conducted several investigations at the Site, including a Further Site Investigation (FSI) in August and September 2016 (Patriot Project Number 16-1158-01E). The final FSI report was issued to IDEM on January 10, 2017. The IDEM reviewed the FSI report, as well as an FSI report for the adjacent Reed property prepared by Ramboll Environ, and issued its Further Site Investigation Review Letter. The letter stated that “Both property owners must continue to work together to determine the origin of the cVOC contamination near the property line”, and provided specific comments regarding each property. IDEM’s comments for the HRID property are provided below, followed by a summary of the activities conducted by Patriot during this ASI to address the comment.

IDEML Comment #1: The highest concentrations of chlorinated volatile organic compounds (cVOCs) in the shallow soil were identified in the sparsely wooded area that straddles the two properties south of the two facilities. The highest cVOC concentrations in shallow soils were identified in boring EBH-12 within the wooded area on the Reed property. The highest concentration of tetrachloroethylene (PCE) in the deeper soil samples was reported in soil boring PB-27, downgradient and in close proximity to the wooded area. IDEM agrees with the conclusion that additional investigation is needed to determine the source of contamination and if it is from the wooded area.

Patriot and Ramboll Environ concurrently performed soil sampling and analysis in and adjacent to the wooded area along the common boundary between the two properties. (See Section 3.2)

IDEML Comment #2: CVOC contamination is not delineated to the east. Additional monitoring wells are needed down gradient of monitoring well MW-12, MW-22, and MW29.

Existing monitoring wells MW-14 and MW-15 are located down gradient of monitoring wells MW-12, MW-22 and MW-29, but were not sampled during the FSI because they are located in a heavily wooded area and dense vegetation growth prevented access to locate and sample the wells. (see response to IDEM Comment #3). Monitoring wells MW-14 and MW-15 were located and sampled during this ASI, fulfilling IDEM's requirement for down gradient sampling. (See Section 3.4)

IDEM Comment #3: Monitoring wells MW-14 and MW-15 down gradient of the property line must be sampled during all future sampling events.

As stated above, monitoring wells MW-14 and MW-15, as well as monitoring wells MW-16, MW-17 and MW-28, are located in a heavily wooded area where dense vegetation growth prevented access to locate and sample the wells. During this ASI, the vegetation was cleared, and monitoring wells MW-14, MW-15, MW-16, and MW-28 were accessed and sampled during this ASI. (See Section 3.4)

IDEM Comment #4: Vapor intrusion (VI) sampling revealed trichloroethylene (TCE) exceeding the Commercial Sub-Slab Screening Level (CSSSL) and the Commercial Indoor Air Action Level (CIAAL) at the Crossroads Recycling building. IDEM concurs that additional action at the Crossroads building is warranted. VI investigations must take place at the tenant spaces in the Crossroads building. Due to concentrations of TCE in monitoring wells MW-12, MW-22, and MW-29, VI investigations must take place at all remaining on-Site buildings at the Hurricane Road Industrial Development because they are within 100 feet of the aforementioned monitoring wells.

The methodologies and findings of the vapor intrusion (VI) investigation will be provided to IDEM under separate cover.

IDEM Comment #5: Vertical ground water profiling remains undefined on-site and must be delineated. Additional monitoring wells are needed on both properties for this purpose.

Patriot installed two deeper groundwater monitoring wells on the Site (MW-31 and MW-32) to conduct vertical groundwater profiling. (See Section 3.3) Ramboll Environ also installed one groundwater monitoring well (EMW-1D) on the Reed property for the same purpose.

Following receipt of the IDEM's letter, *Patriot* and Ramboll Environ collaborated to develop and implement a scope of work to address IDEM's directives.

3.0 ADDITIONAL SITE INVESTIGATION ACTIVITIES

3.1 Clearing of overgrowth and debris

The investigative borings were advanced in an area along the Reed/HRID property boundary that was overgrown and contained a significant amount of concrete, rocks, logs, and other debris. *Patriot* and Ramboll Environ jointly retained an environmental excavating firm to clear the debris and overgrowth to allow access for the soil sampling equipment.

As previously stated, monitoring wells MW-14, MW-15, MW-16, MW-17, and MW-28 are located in a heavily wooded area along the eastern half of the HRID property. Access to the wells had been cleared when the wells were installed, but overgrowth of the wooded area over time had resulted in these wells being inaccessible. *Patriot* utilized the environmental excavation subcontractor to reopen access to these wells for sampling.

3.2 Soil Investigation

Patriot mobilized to the Site on August 16 and 17, 2017 to advance six soil borings on the Site (PB34 through PB-39) in or near the wooded area on the common boundary with Reed. *Patriot* also provided oversight as Ramboll Environ concurrently advanced five borings (EB29 through EB33) on the adjoining Reed property in or near the wooded area along the common boundary. Ramboll also collected a soil sample for laboratory analysis from the boring for deeper monitoring well EMW-1D located east of the wooded area. The *Patriot* and Ramboll Environ boring locations are shown on the Soil Boring Location Map provided as Figure 3 in Appendix A. The area under investigation in this ASI included a densely-wooded area that extends onto both properties and contains miscellaneous fill material and debris. A semi-circular concrete structure that was reportedly used by Houghland to contain residual vegetable material from the canning operations for use as cattle feed is located on the southern edge of the wooded area on the Reed property. The wooded area and concrete structure are shown on Figure 2 and Figure 3.

Prior to the previous subsurface investigation activities, the property boundary between the Site and the Reed property was marked by a licensed surveyor to assist in accurately locating the boring locations in the field. Public underground utilities on both properties were located and marked by Indiana Underground Plant Protection Services. Bloodhound Underground was also retained to locate and mark any underground

utilities or structures in the investigation area using ground penetrating radar and electromagnetic imaging.

Six soil borings were advanced on the Site to a depth of approximately 20 feet below ground surface (bgs) using a Geoprobe® direct push sampling rig equipped with dual core samplers. All sampling was performed in accordance with standard United States Environmental Protection Agency (U.S. EPA) and IDEM protocols for environmental investigations. All equipment coming into contact with the samples designated for analysis was decontaminated before and during use. Decontamination of sampling equipment involved cleaning with non-phosphate detergent wash and distilled water rinses.

Soil samples from the Geoprobe® borings were obtained using a 2-inch diameter, stainless steel, dual core barrel sampler equipped with an acetate liner. Soil samples were collected by hydraulically pushing the sampler to the desired depth. The sampler was then recovered with a continuous soil sample within the acetate liner inside the barrel. A new acetate liner was used for each sample collection. Subsequent samples were collected by advancing the sampler to the deeper target zone.

Following collection, the lithology of each soil sample was visually classified in accordance with the Unified Soil Classification System and field screened for odor, staining, and the presence of volatile organic vapors using headspace analysis. The field screening procedure is typically used to qualitatively determine if petroleum products or volatile organic compounds (VOCs) are present in the soil samples. Headspace analysis was conducted by placing a portion of the sample in a sealed zip-lock plastic bag and allowing the sample to equilibrate for approximately 5 minutes. A Mini-Rae photoionization detector (PID) organic vapor analyzer was used to measure the concentration of total photoionizable vapors (TPVs) emitted from the sample. The soil lithology and field screening results were recorded on soil boring logs, which are included as Appendix B.

One soil sample was collected for laboratory analysis from the upper 2 feet of each boring. On the basis of odor, staining, TPV response, and professional judgement, one additional soil sample was collected from each soil boring at the depth interval determined most likely to contain COC impacts. Samples selected for laboratory analysis were collected using laboratory-supplied Method 5035 Terracore sampling kits. The soil samples were labeled, placed on ice in a cooler, and delivered to Pace Analytical Services, Inc. (Pace), in Indianapolis, Indiana, using chain-of-custody controls. Soil samples were analyzed for VOCs using U.S. EPA SW-846 Method 8260.

Quality assurance/quality control (QA/QC) procedures included the collection and analysis of a duplicate sample (PB-35 13-15), a matrix spike/matrix spike duplicate (MS/MSD) sample (PB-39 3-5), and a trip blank. After completion, the soil borings were backfilled with bentonite. All investigation-derived waste was placed in 55-gallon steel drums and stored on-Site pending disposal.

3.3 Vertical Groundwater Profiling

3.3.1 Groundwater Grab Sampling

Patriot advanced two deeper soil borings on the Site (PB40 and PB41) to collect groundwater samples for vertical contaminant profiling. Boring PB-40 was advanced adjacent to monitoring well MW-30, where the highest concentrations of groundwater COCs have previously been reported. Boring PB-41 was advanced adjacent to monitoring well MW-26, immediately south of the main site building. Boring PB-40 was advanced to a depth of 35 feet bgs where refusal was encountered and boring PB-41 was advanced to a depth of 38 feet bgs where refusal was encountered. Boring logs for borings PB40 and PB41 are included in Appendix B. When the maximum depth of each boring was reached, a groundwater grab sample was collected using dedicated plastic tubing with a bottom check valve. The Geoprobe® tooling was then withdrawn approximately one-third of the distance between the bottom of the boring and the top of the water table, where another groundwater grab sample was collected using the same methodology. The Geoprobe® tooling was then further withdrawn to another one-third of the distance between the bottom of the boring and the top of the water table, where a third groundwater grab sample was collected. Groundwater samples were collected from boring PB40 at depths of 29 to 33 feet bgs, 15 to 19 feet bgs, and 6 to 10 feet bgs. Groundwater samples were collected from boring PB41 at depths of 30 to 34 feet bgs, 24 to 28 feet bgs, and 15 to 20 feet bgs.

The groundwater samples were placed in appropriate sample containers, labeled, placed on ice in a cooler, and delivered to Pace using chain-of-custody controls. The six groundwater samples, along with one duplicate sample, one MS/MSD sample, and one trip blank were analyzed for VOCs by U.S. EPA SW-846 Method 8260.

Upon completion of sampling, the borings were backfilled to grade using bentonite chips.

3.3.2 Installation of Groundwater Monitoring Wells

Patriot evaluated the analytical results for the groundwater grab samples to determine the appropriate depth to install groundwater monitoring wells. At both boring locations,

the grab sample analysis indicated that the COC concentrations decreased with depth, and there was no evidence of dense, not-aqueous phase liquid (DNAPL). Groundwater monitoring well MW-31 was installed to a depth of 30 feet bgs adjacent to soil boring PB-40 and monitoring well MW-32 was installed to a depth of 33 feet bgs adjacent to soil boring PB-41. A hollow-stem auger drilling rig was used to advance each boring to the desired depth. The monitoring well was constructed of a 5-foot long section of 2-inch diameter, 0.010 inch slotted polyvinyl chloride (PVC) screen and a sufficient length of 2-inch diameter PVC riser to reach the ground surface. A sand pack was placed around the well screen to a depth of approximately one 1 foot above the well screen. A 1-foot thick bentonite seal was placed above the sand pack, and the remaining annular space was filled with bentonite chips to approximately 1-foot bgs. The well was then completed flush with the ground surface with a lockable expansion-type cap and an 8-inch diameter, steel, flush-mount protective cover set in a concrete pad. The groundwater monitoring well diagrams for MW-31 and MW-32 are included in Appendix B, and their locations are depicted on Figures 2 and 3.

3.4 Monitoring Well Sampling

Patriot mobilized to the Site on August 21-22, 2017 to conduct groundwater sampling from select monitoring wells at the Site. Four of the 23 monitoring wells were not sampled during this ASI, including: MW-17, which is located at the far northeastern corner of the property beyond wells MW-16 and MW-28 that have never shown groundwater impacts; MW-18 and MW-19, which are located upgradient of both the Site and the Reed property; and MW-25, which is located between two buildings on the northwestern portion of the Site and was covered with equipment and materials. The remaining 17 monitoring wells were sampled using low-flow purging and sampling techniques. The well depths and screened intervals are provided on Table 1 in Appendix C and the monitoring well locations are shown on Figure 2.

Prior to sampling, each of the monitoring wells was gauged using an electronic water level meter. The depth to groundwater and total well depth from the surveyed top of casing was measured to the nearest 0.01 foot at each well. The water level probe and tape were decontaminated with a non-phosphate detergent wash and distilled water rinses after use at each well to prevent cross contamination. The depth to groundwater measurements and corresponding groundwater elevations for the ASI and previous gauging events are provided in Table 2 in Appendix C. A groundwater potentiometric surface map developed from the groundwater elevations is provided as Figure 4 in Appendix A.

The groundwater monitoring wells were sampled in accordance with the low-flow sampling method outlined in the IDEM Micro-Purge Sampling Option Technical Guidance Document (TGD) (June 3, 1998, revised November 3, 2009). The low-flow sampling was conducted using a submersible pump to purge and sample the monitoring wells at low flow rates of 50-200 milliliters per minute (ml/min). During the low-flow purging, a multi parameter water quality probe (Horiba Model U22) with a flow-through cell was used to measure pH, conductivity, turbidity, dissolved oxygen (DO), temperature, total dissolved solids (TDS), and oxidation-reduction potential (ORP). Groundwater samples were collected once the parameter values stabilized in accordance with the criteria stated in the IDEM technical guidance document. The data collected during the sampling activities were recorded on groundwater sampling field data forms, which are provided in Appendix D.

The ground water samples were collected in new laboratory-supplied 40 milliliter amber glass vials with Teflon-lined caps preserved with hydrochloric acid. The sample containers were labeled, placed on ice in a cooler, and delivered to Pace using chain-of-custody controls. Groundwater samples were analyzed for VOCs using U.S. EPA SW-846 Method 8260. QA/QC procedures included the collection and analysis of one duplicate groundwater sample at MW-23 and one trip blank. The laboratory results were reported with Level IV DQO.

The pump was decontaminated after use at each well with non-phosphate detergent wash followed by a triple distilled-water rinse. New disposable polyethylene tubing was used at each well location. All monitoring well purge water and decontamination water was containerized in sealed 55-gallon drums pending disposal at an off-site licensed disposal facility.

4.0 INVESTIGATION RESULTS

4.1 Soil Results

4.1.1 Field Observations

The soils encountered during the ASI consisted primarily of brown medium stiff silt to a depth of approximately 5 to 9 feet bgs. Surficial fill material was encountered above the silt in borings PB35, PB37, PB38, PB40 and PB41 to depths ranging from 2 to 4 feet bgs. The silt was primarily underlain by well-graded sand to the depth of the borings. Groundwater was encountered under unconfined conditions at depths ranging from 5 to 16 feet bgs, with the changes in depth generally corresponding to changes in the ground surface elevation.

Field inspection of the soil samples did not reveal any odors, staining or other sensory evidence of potential COC impacts. Field PID monitoring revealed TPV readings ranging from non-detectable to less than 24 parts per million (ppm) in all of the borings.

The lithologic descriptions, field screening results, groundwater levels and soil sampling depths are provided on the boring logs in Appendix B.

4.1.2 Analytical Results

A total of 12 soil samples were collected from the six soil borings advanced at the Site and were analyzed for VOCs. The analytical results were compared to the IDEM Remediation Closure Guide (RCG) Soil Migration to Groundwater Screening Levels (MTGSLs), as well as the RCG soil Residential, Commercial/Industrial, and Excavation Direct Contact Screening Levels (DCSLs). The soil analytical results for this ASI and the previous FSI on both the Site and the adjacent Reed property are summarized on Table 3 in Appendix C and are plotted on the Soil Analytical Data Map included as Figure 5 in Appendix A. The soil analytical laboratory results and chain-of-custody forms are provided in Appendix E.

PCE and TCE were detected in four of the six shallow (0 to 2 feet) soil samples, but at concentrations that did not exceed any of the RCG Screening Levels. Deeper soil samples collected from borings PB-34 (13 to 15 feet), PB-35 (13 to 15 feet), PB-36 (8 to 10 feet), PB-37 (8 to 10 feet) and PB-38 (8 to 10 feet) exceeded the RCG MTGSLs for PCE and TCE, but did not exceed any of the DCSLs. The highest concentration of TCE in the deeper samples was 0.18 mg/kg in boring PB-34 (13-15 feet) and the highest concentration of PCE in the deeper samples was 4.2 mg/kg in boring PB-37 (8 to 10 feet).

Ramboll Environ collected 11 soil samples from the six borings on the Reed property. Four of the five shallow soil samples contained PCE and TCE above the RCG MTGSL. The highest PCE and TCE concentrations in the Reed property shallow soil samples were 5.3 mg/kg and 3.0 mg/kg, respectively, both of which were from boring EB-32. Deeper soil samples collected from all six of the Reed property borings exceeded the RCG MTGSL for PCE, but did not exceed any of the DCSLs. Deeper soil samples collected from five of the six Reed property borings exceeded the RCG MTGSL for TCE, but did not exceed any of the DCSLs. The highest PCE and TCE concentrations in the Reed property deeper soil samples were 10.1 mg/kg and 0.69 mg/kg, respectively, both of which were from boring EB 32.

4.2 Vertical Groundwater Profiling Results

Groundwater grab samples were collected at three depths from borings PB-40 and PB-41 to vertically profile the groundwater COCs prior to installing a deeper monitoring well in each boring. Groundwater samples collected from 6 to 10 feet bgs and 15 to 19 feet bgs in boring PB-40 showed no significant change in PCE and TCE concentrations. The groundwater sample collected from 29 to 33 feet bgs in boring PB-40 showed a one order of magnitude decrease from the two shallower samples. Lower permeability clay layers were present at depths of 19 to 20 feet bgs and 22 to 25 feet bgs, between the two shallower samples and the deeper sample. The clay layers appear to be acting as confining layers limiting the downward migration of COCs in this location. Groundwater samples collected at depths of 15 to 20 feet bgs, 24 to 28 feet bgs, and 30 to 34 feet bgs in boring PB-41 showed a slight decrease in PCE concentrations, from 22.5 micrograms per liter (ug/L) in the shallow sample to 18.4 ug/L in the two deeper samples. TCE concentrations dropped from 64.5 ug/l in the shallow sample to 53.4 ug/L in the intermediate sample and to 21.1 ug/L in the deep sample. No clay layers were encountered between the sample depths in boring PB-41. Gray, moist stiff clay was encountered from 26 feet bgs to the base of the boring at 35 feet bgs in boring PB-40, and from 32 feet bgs to the base of the boring at 38 feet bgs in Boring PB-41. The laboratory analytical results from the groundwater grab samples are summarized in Table 4 in Appendix C, and the analytical reports are provided in Appendix E.

As previously stated, monitoring well MW-31 was installed to a depth of 30 feet bgs adjacent to boring PB-40 and monitoring well MW-30, and monitoring well MW-32 was installed to a depth of 33 feet bgs adjacent to boring PB-41 and monitoring well MW-26. These monitoring wells were sampled during the groundwater sampling event described in Sections 3.4 above and 4.3 below. Comparison of the PCE and TCE concentrations between monitoring wells MW-30 (screened from 4.5 to 14.5 feet bgs) and MW-31 (screened from 25 to 30 feet bgs) revealed that PCE decreased from 475 ug/L to 5.7 ug/L, and TCE decreased from 253 ug/L to <5 ug/L. Comparison of the PCE and TCE concentrations between monitoring wells MW-26 (screened from 13 to 23 feet bgs) and MW-32 (screened from 28 to 33 feet bgs) revealed that PCE decreased from 21.8 ug/L to 11.0 ug/L, and TCE decreased from 48 ug/L to <26.9 ug/L. A low concentration of cis-1,2-DCE was reported in the sample from MW-31, but was not present in the sample from MW-26.

The analytical data indicate that groundwater COC concentrations decrease with depth and that no DNAPL is present in these areas.

4.3 Groundwater Monitoring Well Sampling Results

4.2.1 Groundwater Flow Data

Groundwater elevations were gauged from monitoring wells on the HRID on August 21, 2017. The results were plotted on the groundwater potentiometric surface map included as Figure 4. The groundwater flow trends in southerly direction across the norther half of the Site, and in an easterly direction across the southern half of the Site and the Reed property. The groundwater flow directions appear to be consistent with previous well gauging events.

4.2.2 Analytical Results

A total of 19 groundwater samples were collected from the Site. *Patriot* compared the groundwater analytical results to the RCG Groundwater Residential Tap Water Screening Levels (TWSLs) and the RCG residential and commercial/industrial Vapor Exposure Screening Levels (VESLs). The groundwater analytical results from the ASI and the corresponding RCG Screening Levels are summarized on Figure 6 in Appendix A, while the groundwater analytical results from the ASI and previous investigations are shown on Table 5 in Appendix C. The groundwater analytical laboratory report and chain of custody form are included in Appendix G.

PCE, TCE and cis-1,2-DCE were the only COCs detected in the groundwater samples. Cis-1,2-DCE was detected in the samples from monitoring wells MW-28 and MW-32 at concentrations of 47.7 ug/L and 19.1 ug/L, respectively; both of which are below the RCG TWSL of 70.0 ug/L. PCE exceeded the RCG TWSLs in nine of the 19 samples, the RCG Residential VESL in 4 of the samples, and the RCG Commercial/Industrial VESL in one of the samples. The highest concentration of PCE was reported in the sample from MW-30 at 475 micrograms per liter (ug/L). TCE exceeded the RCG TWSL and Residential VESL in nine of the 19 samples, and the RCG Commercial/Industrial VESL in eight of the samples. The highest concentration of TCE was also reported in the sample from MW-30 at 253 ug/L. The PCE and TCE concentrations reported for the samples collected during this ASI differed slightly from the previous groundwater sampling events, but there were no significant increases or decreases. Some of the data show a slightly downward trend in the COC concentrations, but there are not enough data to determine a statistically valid trend.

5.0 CONCLUSIONS

In response to IDEM's April 4, 2017 Further Site Investigation Review letter, *Patriot* and Ramboll Environ conducted additional investigation on the HRID and Reed properties,

which collectively make up the former Houghland property. The purpose of the additional investigation was to further evaluate the nature and extent of COC-impacts at the properties and evaluate potential source area(s) of the COCs on the properties.

The results of the soil investigation confirmed that TCE and PCE impacts are present in shallow soils and deeper soils along the common property line between the HRID and Reed properties, and that the concentrations of TCE and PCE are generally greater in the subsoils than the surface soils. The TCE and PCE impacts appear to be associated with a small wooded area that straddles the property line. Although the additional investigation revealed additional information on the nature of the TCE and PCE impacts in the soil, no obvious source of the COC impacts was identified. The highest concentrations of TCE and PCE in shallow soils detected on the Site during investigations conducted to date are 0.22 mg/kg and 0.28 mg/kg, respectively, both of which are from boring PB-24 located slightly northeast of the wooded area. The highest concentration of TCE in shallow soil on the Reed property is 3.0 mg/kg from boring EB-32, located in the wooded area just east of the semi-circular concrete structure. The highest concentrations of PCE in the shallow soil on the Reed property are 5.3 mg/kg from boring EB-32, and 7.4 mg/kg from boring EB-12, located in the wooded area east of boring EB-32 and west of the property line. The highest concentrations of TCE and PCE detected in deeper soils at the Site are 0.24 mg/kg and 7.8 mg/kg, respectively, both of which are from boring PB-27 located east of the wooded area. The highest concentrations of TCE and PCE in the deeper soils on the Reed property are 0.69 mg/kg and 10.1 mg/kg, both of which are from boring EB-32 located in the wooded area just east of the semi-circular concrete structure. Figures showing the extent and relative concentrations of TCE greater than the RCG TWSL in shallow and deeper soil are included as Figures 7 and 8, respectively, in Appendix A. Figures showing the extent and relative concentrations of PCE greater than the RCG TWSL in shallow and deeper soil are included as Figures 9 and 10, respectively, in Appendix A.

Groundwater sampling revealed that TCE and PCE exceeded the RCG TWSLs on the southern portion of the Site, with the highest concentrations near the western property boundary downgradient from the wooded area. The TCE and PCE concentrations decrease from west to east across the Site. PCE impacts are contained on the Site, but TCE is present at concentrations above the RCG Commercial/Industrial VESL at monitoring well MW-15, located near the eastern boundary of the Site. Samples from monitoring wells MW-14 and MW-16, located on the eastern property boundary south and north of MW-15, respectively, do not contain detectable COC concentrations, so it appears that the groundwater COC plume that may be leaving the site is fairly narrow. Groundwater sampling conducted on the Reed property revealed that monitoring wells

MW-5 and MW-7 are the only wells that contain both TCE and PCE at concentrations above the RCG TWSLs. Monitoring well MW-3 contains TCE at a concentration greater than the RCG TWSL. The highest concentrations of TCE and PCE on the Site during the most recent sampling event are 253 ug/L and 475 ug/L, respectively, both of which are from monitoring well MW-30 located immediately downgradient from the wooded area on the property line. The highest concentrations of TCE and PCE on the Reed property are 53.5 ug/L and 42.8 ug/L, respectively, both of which are from monitoring well MW-7 located on the Reed property's western property line just north of the wooded area.

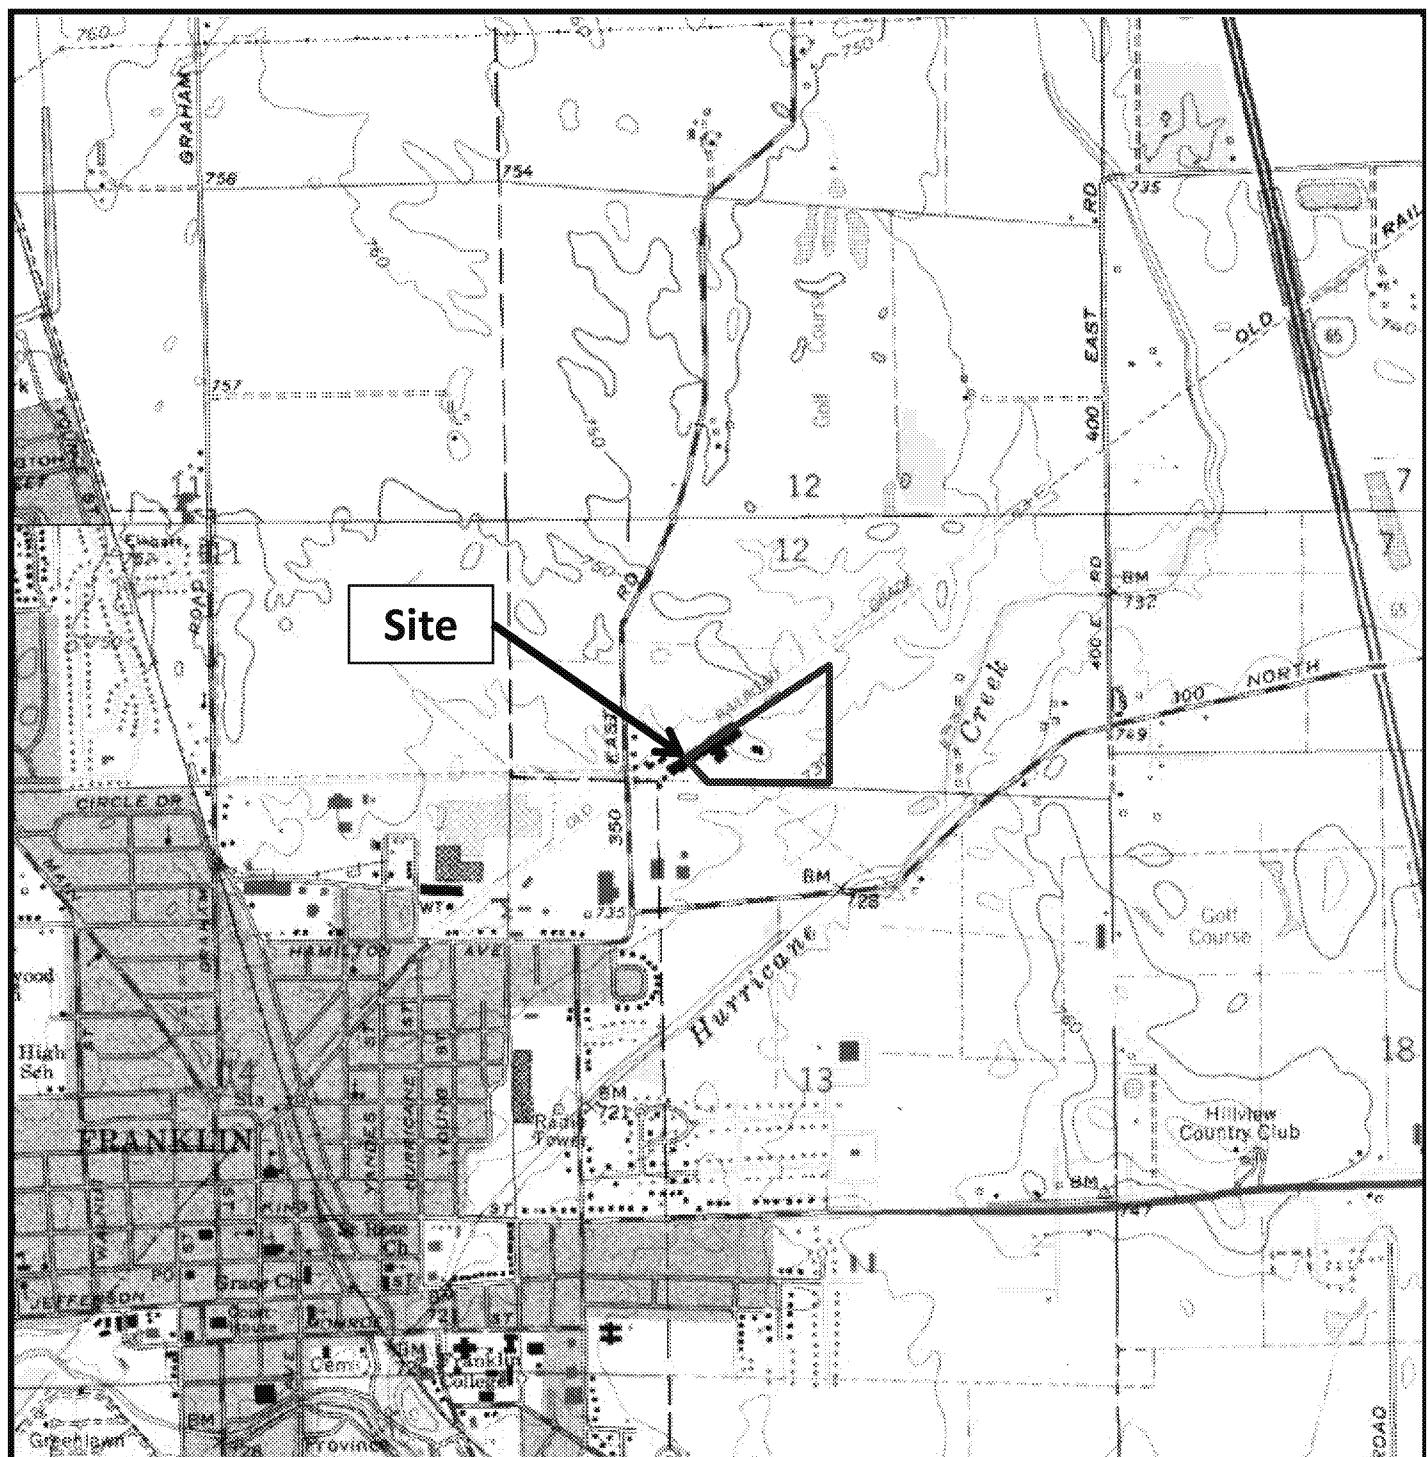

Deeper groundwater impacts at the Site appear to fairly minimal and decrease in concentration when compared to the shallower groundwater.

The investigations conducted to date have not revealed an obvious source area or areas of the soil and groundwater impacts, but the greatest soil and groundwater impacts appears to be associated with the wooded area that straddles the HRID and Reed properties. An additional monitoring well or groundwater sampling in the wooded area on the Reed property between the concrete structure and the HRID/Reed property line may provide a better understanding of groundwater impacts in and around the wooded area, and determine whether the elevated soil TCE and PCE impacts in and around borings EB-32 and EB-30 correlate to elevated groundwater TCE and/or PCE impacts in the wooded area and downgradient of the semi-circular concrete structure.

Additional source areas or preferential contaminant migration pathways may be responsible for the groundwater impacts on the northwest portion of the Site in the vicinity of monitoring well MW-24. In addition, further groundwater sampling would be necessary to define the extent of off-site impacts to the east of the HRID property.

APPENDIX D

GROUNDWATER SAMPLING DATA LOGS

GROUNDWATER WELL SAMPLING LOG

PROJECT NAME: Former Houghland Tomato Cannery

PROJECT NO/TASK: 17-0995-01E
DATE: 8/21/2017
WELL ID: MW-10
CASING ELEVATION: 738.15 ft
SAMPLING PERSONNEL:

EVENT: Low Flow Sampling

START TIME: 14:20 PM

SAMPLE ID: MW-10

SCREEN DEPTH: 723.75 to 733.75 ft

EVACUATION DATA

DEPTH TO WATER: _____ 6.47 ft **WELL DEPTH:** _____ 14.71 ft
EVACUATION METHOD: Micro-purge evacuation using a stainless steel Monsoon 12V submersible pump with speed controls and well specific polyethylene tubing
PUMP INTAKE SET AT: _____ 12.00 ft **GALLONS PURGED:** _____ 1.10

SAMPLING DATA

SAMPLING METHOD: Micro-purge evacuation and sample

CONSTITUENT:	VOCs by 8260	CONTAINER:	3 x 40mL vials	PRESERVATIVE:	HCL
APPEARANCE:	clear	ODOR:	none	COLOR:	clear

FIELD PARAMETERS

GROUNDWATER WELL SAMPLING LOG

August 07, 2017

Mr. Mike Casper
Patriot Engineering
6150 E. 75th St.
Indianapolis, IN 46250

RE: Project: Houghland Add. Investigation
Pace Project No.: 50176347

Dear Mr. Casper:

Enclosed are the analytical results for sample(s) received by the laboratory on July 27, 2017. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

A handwritten signature in cursive ink that reads "Tina Sayer".

ANALYTICAL RESULTS

Project: Houghland Add. Investigation

Pace Project No.: 50176347

Sample: PB 34 (0-2) Lab ID: 50176347001 Collected: 07/26/17 08:50 Received: 07/27/17 09:47 Matrix: Solid

Results reported on a "dry weight" basis and are adjusted for percent moisture, sample size and any dilutions.

ANALYTICAL RESULTS

Project: Houghland Add. Investigation

Pace Project No.: 50176347

Sample: PB 35 (0-2) Lab ID: 50176347003 Collected: 07/26/17 09:30 Received: 07/27/17 09:47 Matrix: Solid

Results reported on a "dry weight" basis and are adjusted for percent moisture, sample size and any dilutions.

ANALYTICAL RESULTS

Project: Houghland Add. Investigation

Pace Project No.: 50176347

Sample: PB 36 (8-10) Lab ID: 50176347007 Collected: 07/26/17 10:40 Received: 07/27/17 09:47 Matrix: Solid

Results reported on a "dry weight" basis and are adjusted for percent moisture, sample size and any dilutions.

ANALYTICAL RESULTS

Project: Houghland Add. Investigation

Pace Project No.: 50176347

Sample: PB 37 (8-10) Lab ID: 50176347009 Collected: 07/26/17 11:25 Received: 07/27/17 09:47 Matrix: Solid

Results reported on a "dry weight" basis and are adjusted for percent moisture, sample size and any dilutions.

QUALIFIERS

Project: Houghland Add. Investigation
 Pace Project No.: 50176347

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

- L2 Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low.
- N2 The lab does not hold NELAC/TNI accreditation for this parameter.
- R1 RPD value was outside control limits.

RE: Project: Houghland Add. Investigation
Pace Project No.: 50176495

Dear Mr. Casper:

Enclosed are the analytical results for sample(s) received by the laboratory on July 28, 2017. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

A handwritten signature in cursive ink that reads "Tina Sayer".

ANALYTICAL RESULTS

Project: Houghland Add. Investigation

Pace Project No.: 50176495

Sample: PB 38 (8-10) Lab ID: 50176495002 Collected: 07/28/17 07:50 Received: 07/28/17 14:00 Matrix: Solid

Results reported on a "dry weight" basis and are adjusted for percent moisture, sample size and any dilutions.

ANALYTICAL RESULTS

Project: Houghland Add. Investigation

Pace Project No.: 50176495

Sample: PB 39 (3-5) Lab ID: 50176495004 Collected: 07/28/17 08:20 Received: 07/28/17 14:00 Matrix: Solid

Results reported on a "dry weight" basis and are adjusted for percent moisture, sample size and any dilutions.

REPORT OF LABORATORY ANALYSIS

Pace Analytical Services, LLC
 7726 Moller Road
 Indianapolis, IN 46268
 (317)228-3100

QUALIFIERS

Project: Houghland Add. Investigation
 Pace Project No.: 50176495

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

- L2 Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low.
- M0 Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
- N2 The lab does not hold NELAC/TNI accreditation for this parameter.
- R1 RPD value was outside control limits.
- RS The RPD value in one of the constituent analytes was outside the control limits.

August 25, 2017

Mr. Mike Casper
Patriot Engineering
6150 E. 75th St.
Indianapolis, IN 46250

RE: Project: Houghland Canning
Pace Project No.: 50178310

Dear Mr. Casper:

Enclosed are the analytical results for sample(s) received by the laboratory on August 23, 2017. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

A handwritten signature in black ink that reads "Tina Sayer".

QUALIFIERS

Project: Houghland Canning
 Pace Project No.: 50178310

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

N2 The lab does not hold NELAC/TNI accreditation for this parameter.
